Iphone not sending pictures to android. Iphone not sending pictures to android 2022. Problems sending pictures from iphone to android. Why isn't my iphone sending pictures to android.

By David Weinberg i Justin Sullivan/Getty Images News/Getty Images The Android smartphone is designed to integrate with your Google account to keep your personal information synchronized between the phone and Google's online applications like Gmail and Google Calendar. Each of the Google apps on your phone can access this information, allowing you to link certain information, such as calendar entries, to other information, like contact names. By adding contacts to your calendar entries, you can keep track of who will be participating in events with you, and you can quickly contact those people directly from the calendar entry. Google will also send your guests information about the event in an invitation. Tap the "Calendar" icon on the Android's home screen or in the application drawer to open the calendar application. Tap a date to view your appointments for that day. Tap an appointment for more information on the event. Press your phone's "Menu" button and tap "Edit." Scroll down to the "Guests" field and tap the text entry area. Tap the "Contact" button to bring up a list of the contacts on your phone. Scroll through the list and tap a contact to add that individual to the current event. Tap "Save" to save the changes to your event. This will also send out invitations to your guest list. Tap the guest's name on the event's details page to bring up a list of contact options. Tap a contact option to call, message or email the contact. Verizon's HTC Droid Incredible runs the Sense interface on top of Android OS 2.1. The Droid Incredible (\$200 with a two-year contract) features a 3.7-inch AMOLED touchscreen display, a fast 1GHz processor, an 8-megapixel camera, MicroSD-card expansion up to 32 gigabytes, multitasking, and the Friend Stream social network aggregator. The Droid Incredible lacks a physical keyboard. Its touchscreen provides the primary user interface; voice command is also an option for calls, search, and GPS navigation. For more information on this and the other phones shown here, check out our Top 10 Android Smartphones chart. Verizon's Motorola Droid features a slide-out keyboard, a 3.7-inch, 480-by-854-pixel touchscreen display, Android OS 2.1, MicroSD-card expansion up to 32 gigabytes, Wi-Fi and Bluetooth 2.1 support, a 5-megapixel camera, and hardware-accelerated graphics. The Droid (\$200 with a two-year contract) features an excellent and surprisingly fun voice-enabled search and GPS navigation capability. This makes the Droid stand out from older Android smartphone offerings. The T-Mobile Samsung Behold II has a brilliant 3.2-inch, 320-by-480-pixel AMOLED capacitive touchscreen display, a 5-megapixel camera, and TouchWiz 2.0, a touch-friendly user interface running over the now-outdated Android OS 1.5. Note: the newest Android Market apps may require Android OS 2.1 for full functionality. The first Android smartphone to run Android OS 2.1, the Google Nexus One boasts a brilliant 3.7-inch, 400-by-800-pixel AMOLED display, a fast 1GHz Snapdragon processor from Qualcomm, a 5-megapixel camera, and voice-powered navigation and search software. This phone is offered for direct purchase by Google for \$529, and also by T-Mobile for \$179 with a two-year contract. Reports of problems with poor network reception issues have reduced the appeal of this phone, and both Sprint and Verizon have decided to nix the Nexus One. The T-Mobile Motorola Cliq features a slide-out keyboard, a 3.1-inch, 320-by-480-pixel capacitive touchscreen display, and the MotoBlur social network aggregator. The Cliq (\$150 with two-year contract) has Wi-Fi support, turn-by-turn GPS, a 5-megapixel camera, and a standard 3.5-mm headphone jack. It runs the now-dated Android OS 1.6, so don't expect some of the latest Android OS 2.1 apps to work. The Sprint Samsung Moment (\$100 with a two-year contract) features a slide-out keyboard, a 3.2-inch, 320-by-480-pixel AMOLED capacitive touchscreen display, a 3.32-megapixel camera, and Android OS 1.5. Prospective buyers should be aware that the Moment does not take advantage of the latest features to be found in Android OS 2.1. Sprint's HTC Hero (\$100 with a two-year contract) features a 3.2-inch, 480-by-320-pixel touchscreen display with multitouch, pinch-to-zoom functionality. One of the biggest draws of the Hero is that it is the first Android handset to support Flash Lite 9. Unfortunately, video playback remains a mixed bag—many video sites still don't play properly. The HTC Hero has a 5-megapixel camera and a 3.5-mm headphone jack. It is becoming a little outdated with the release of newer Android smartphones like the EVO 4G, and its current price reflects that fact. The T-Mobile myTouch 3G (available for \$150 with a two-year contract) features a 3.2-inch, 320-by-480-resolution (HVGA) capacitive touchscreen display, a 3-megapixel camera, and the MotoBlur social network aggregator. The Devour is similar in appearance to the Droid, but has lower-spec hardware. The Devour runs the older Android OS 1.6, whereas the Droid runs Android 2.1, so some newer Android Market apps may not perform well. The HTC Droid Eris is offered by Verizon for \$80 with a two-year contract. Lacking a physical keyboard, the handset relies on a 3.2-inch, 480-by-320-pixel touchscreen for navigation. The Droid Eris has a 528MHz Qualcomm MSM 7600 CPU, a 5-megapixel camera, Wi-Fi, Bluetooth 2.0, and a GPS receiver. However, the phone runs the Android OS 1.5, which means that it can't take advantage of some of the most recent features available in Android OS 2.1. If that doesn't bother you, the Droid Eris should be a cheaper alternative to the Droid. For more smartphone coverage, check out our Get Smart: PCWorld's Top 10 Smartphones slideshow, our Top 10 Cell Phones chart, and our Top 10 Android Phones chart. Gmail on the web: Compose a message, and then drag and drop the picture from your computer to the desired position in the email. Or, position the cursor where you want the image to appear, select Insert Photo > Inline, then choose your photo and select Insert. Gmail app: Tap the paperclip, select Attach file, then choose the photos you want to send. Pictures are sent inline by default. This article explains how to add an inline image to a Gmail message so that the image appears in the body of the email. Instructions cover Gmail on the web and the Gmail mobile app for iOS and Android. To add an image or photo inline to an email you are composing in Gmail on the web with a desktop browser: Select the Expand window icon (the double-sided arrow) in the upper-right corner of the composition window to make it larger. Drag and drop the picture from its folder on your computer to the desired position in the message. You also can paste the image at the desired location in the email from the clipboard using Control+V (for Windows and Linux) or Command+V (for Mac). Alternatively, you can use an image you found on the web or upload one from your computer. Position the text cursor where you want the image to appear. Select the Insert Photo icon in the formatting toolbar. Select Inline next to Insert images to have the pictures appear inside the email. Choose As attachment to send the photo as an attachment. To upload an image from your computer, select Upload >

Choose photos to upload and open the desired graphic. Images you upload from your computer remain available in the Insert image dialog box while you compose the message (but not for other emails). To insert a picture from Google Photos, go to the Photos tab, photos are organized the same way as in your Google Photos albums. To use an image found on the web, go to the Web Address (URL) tab and enter the image's URL next to Paste an image URL here. Images from the web appear inline with the message. These images are never sent as attachments. Any recipient who has remote images blocked won't see the image. Select Insert. To send a photo on Gmail using the iOS or Android app: While composing a message or reply, tap the attachment paperclip icon () and select Attach file from the menu that appears. In iOS, Gmail needs access to Photos. To enable Photos, open the Settings app and tap Gmail > Allow Gmail to Access. Select the photos you want to send.

By default, the picture is sent inline. Thanks for letting us know! Get the Latest Tech News Delivered Every Day Subscribe Tell us why! i Jupiterimages/Photos.com/Getty Images Technically speaking, no phone can send pictures through text messages. Short message service (SMS), the standard for sending text messages, supports up to 160 characters of text only. To send pictures, videos and audio files phones use a different service based on SMS and called multimedia message service (MMS). The iPhone can send pictures through MMS, through email and through third-party apps that add functionality for other protocols including FTP, WebDAV and Bonjour. Because SMS only supports text characters, you cannot send an image file through SMS. 2nd generation and later iPhones can send pictures via MMS. If you go to your camera roll in the Photos app, you can press the options icon, select multiple thumbnails, then select "MMS" from the Share menu. To send a single photo, open the image you'd like to send and select "MMS" from the Share menu. You can also send a new image or an image from your camera roll by pressing on the camera icon from within the Messages app. Sending an images via MMS will downsize it to 1024 by 768 pixels. If the recipient of your message does not have cellular service with MMS enabled, usually their carrier will host the image and send them an SMS containing a URL where they can access it via their phone's WAP browser. If you have trouble sending MMS messages, look at the "Messages" section of the Settings app and make sure the slider for MMS Messaging is switched on. The iPhone can send a single image or multiple images in an email as well. To send a single photo, open the image you'd like to send and select "Email" from the Share menu. To send multiple images, go to your camera roll, press the options icon, select multiple thumbnails and choose "Email" from the Share menu. Using the email option on the Share menu downsizes the selected image or images to 800 by 600 pixels. If you want to send images at their full resolution, choose "Copy" instead of "Share," create a new email message and paste the images into it using the press-and-hold context menu. Various third-party apps available through the iTunes store enable the iPhone to send or transfer images using other protocols not native to iOS. Some of these apps allow the iPhone to upload files to a shared folder with a free file host in-the-cloud, like Box.net, Dropbox or MKSync for Syncplicity. Other apps make your iPhone into an FTP client capable of uploading photos directly to the remote server of your choice. Still others provide file transfer capabilities over Wi-Fi using Bonjour and Web-based distributed authoring and versioning (WebDAV).
